### **Conditions:**

- Frequency: 20 MHz
- VDD: 2.5 V, 2.8 V, 3.0 V, 3.3 V
- Pull range: ±6.25 ppm
- Temperature: 25 °C

## Equipment:

Model	Measurement / Purpose
Keysight DSA90604A (6 GHz, 20 Gsps)	Output amplitude, rise/fall time, duty cycle
Keysight 5052B Signal Source Analyzer	Phase noise, integrated phase jitter
Keysight 34980A	Power supply current
Keysight E3631A	Power supply
Keysight 53230A	Frequency

#### Test setup:

For waveform parameters measurement (rise/fall time, amplitude, duty cycle), DUT output is loaded with 10 pF || 10 k $\Omega$ . Output signal is measured using Keysight 1134B active probe with Keysight N5425B probe head. Figure 21 shows test setup diagram for waveform parameters measurement.

For phase noise measurements output is connected to 50  $\Omega$  measurement instrument input through Mini Circuits RF amplifier (ZX60-3018G-S+). Amplifier output is AC coupled. Figure 22 shows test setup diagram for phase noise measurement.

For frequency measurement (stability over temperature, frequency hysteresis, stability over voltage, stability over load, ADEV, TDEV, MTIE) buffered device output is connected to 50  $\Omega$  measurement instrument input (see figure 23).

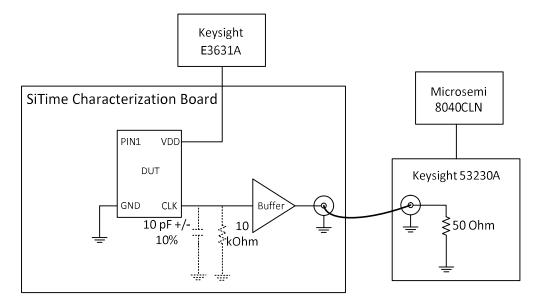

Figure 23: Test setup for measuring frequency

For wander (MTIE, TDEV) measurement AD9548 DPLL is used. DPLL is referenced from rubidium frequency reference. SiTime Super-TCXO is used as system clock for DPLL programmed to different bandwidths. Frequency is measured continuously (gap free mode) with 33 ms gate time. Figure 24 shows setup diagram for wander measurements.
