## Performance report for SiT9366 - 125 MHz, LVDS

### Conditions:

- Frequency 125 MHz
- VDD: 2.5 V, 3.3 V
- Room temperature
- Termination:
  - o 100  $\Omega$  between both outputs.

### Equipment:

Model	Measurement / Purpose
Keysight DSA90604A (6 GHz, 20 Gbps)	Period jitter, differential voltage swing, rise/fall time, duty cycle
Keysight 5052B Signal Source Analyzer	Phase noise, integrated phase jitter
Keysight 34980A	Power supply current
Keysight E3631A	Power supply
Keysight 53230A	Frequency

### Test setup:

For waveform parameters measurement (rise/fall time, differential swing, duty cycle), both DUT outputs are terminated with 100  $\Omega$  differential. Output signals are measured using Keysight 1134B active probe with Keysight N5425B probe head. All measurements are applied to the differential waveform. Figure 1 shows test setup diagram for waveform parameters measurement.

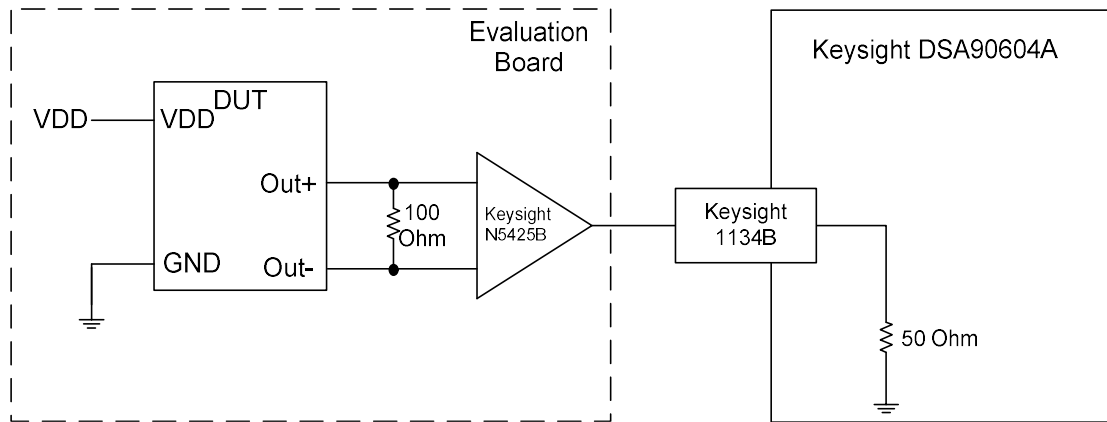

Figure 1: Test setup for measuring waveform parameters (rise/fall time, differential swing, duty cycle)

For period jitter measurement outputs are connected through AC-coupling capacitors to the oscilloscope channels. Signals are subtracted inside the oscilloscope. All measurements applied to differential waveform. Figure 2 shows test setup diagram for period jitter measurement.

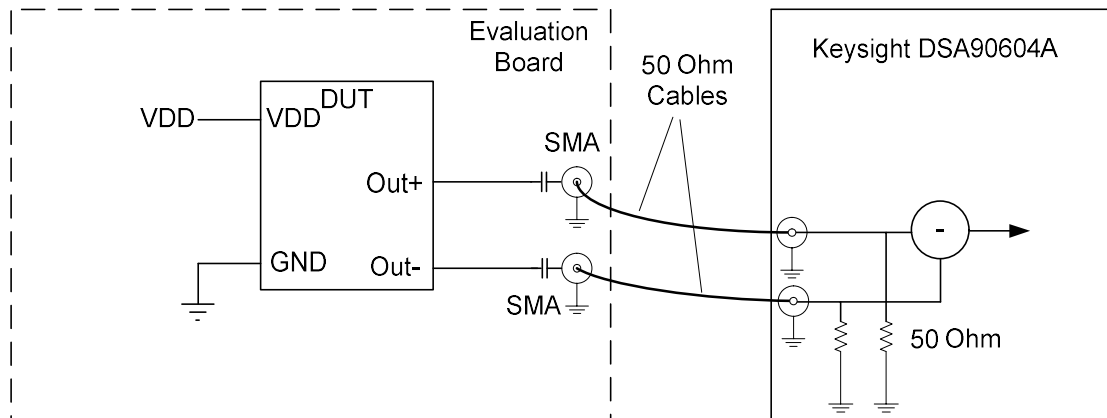

Figure 2: Test setup for measuring period jitter

For phase noise measurements, differential signal is converted to single-ended using impedance matching transformer. Transformer's output is connected to measurement instrument. Figure 3 shows test setup diagram for phase noise measurement.
